Review

Building Bridges: Exploring the Nexus between Bachelor's Degrees in Architecture and Related Services and Google Searches for 'Attacked by a Squirrel'

Charlotte Henderson, Amelia Thomas, Gemma P Turnbull

Center for the Advancement of Research

In this paper, we present the results of an inquisitive investigation into the surprising connection between the number of Bachelor's degrees awarded in Architecture and related services and the frequency of Google searches for the harrowing phrase 'attacked by a squirrel.' With a nod to the acorn-toting neighbors of architectural splendor, we delved into a decade's worth of data from the National Center for Education Statistics and Google Trends to uncover this unexpected correlation. Our findings reveal a remarkably high correlation coefficient of 0.8731619 and an impressively significant p-value of less than 0.01 for the period spanning 2012 to 2021. This connection offers food for thought, much like the industrious squirrels gathering their wits and nuts for winter; it prompts us to ponder the potential factors at play behind such an unforeseen relationship. The unexpected link between architectural education and squirrel-related curious queries beckons further investigation, challenging us to untangle this enigmatic web of statistical significance and arboreal critters. Our research serves as a reminder that even the most seemingly unrelated phenomena might, indeed, have more in common than meets the eye. As our data suggest, when it comes to architectural pursuits and squirrel shenanigans, there might just be more to unpack than initially anticipated.

As the old saying goes, "When it comes to architecture and squirrels, there's more than meets the eye - it's all about building a nest egg." In this paper, we embark on a lighthearted yet statistically rigorous exploration of the intriguing relationship between the number of Bachelor's degrees awarded in Architecture and related services and the frequency of Google searches for the rather unconventional query, 'attacked by a squirrel.' It is a tale of two seemingly disparate domains - one characterized by blueprints and design principles, and the other by bushy-tailed critters with a

penchant for acorn mischief. To uncover this unexpected correlation, akin to the squirrel scurrying through the trees, we conducted a thorough analysis using data from the National Center for Education Statistics and Google Trends. Our aim is not just to entertain, but to enlighten, as we unravel the intertwined narrative between architectural education and arboreal antics.

The idea that pursuing a degree in architecture could potentially lead one down a path that intersects with tales of squirrel encounters may seem as far-fetched as a squirrel storing nuts for a rainy day, but our findings tell a different story. It's as if the squirrel said to the architect, "Let's build some equity together, shall we?"

Our in-depth statistical analysis has revealed a strikingly high correlation coefficient of 0.8731619 and a remarkably significant p-value of less than 0.01 over the period from 2012 to 2021. This discovery is as surprising as stumbling upon a well-hidden stash of acorns - it certainly piques one's curiosity and leaves us grappling with the question: "What do architecture and squirrel tussles have in common, after all?" Our research serves as a reminder that even the most unexpected pairings, much like a squirrel and a bird feeder, can shed light on hidden patterns and associations. It seems that in the world of statistics, we should always remain as vigilant as a squirrel guarding its precious cache of nuts.

As we delve into the quirky world of our findings, we invite you to join us on this statistical journey, where the unexpected convergence of architectural education and peculiar squirrel-related queries continues to defy conventional wisdom. So, hold onto your hard hats and keep an eye out for any bushy-tailed statisticians - the adventure is just beginning!

Prior research

The authors find in "Smith et al." a sobering exploration of the factors contributing to the rise in Bachelor's degrees awarded in Architecture and related services over the past decade. Their analysis delves into the societal, economic, and educational drivers behind this trend, shedding light on the increasing relevance of architectural education in contemporary society. Quite like building a solid foundation for a structure, their work provides a sturdy basis for understanding the academic landscape of architecture.

In "Doe and Jones," a comprehensive study examines the nuances of Google search trends and the evolving nature of online queries. Their findings reveal intriguing shifts in the types of searches conducted and offer valuable insights into the online behaviors of individuals. The correlation between Google searches for 'attacked by a squirrel' and educational pursuits in architecture emerges as an unexpected twist in the virtual tale of internet exploration.

Moving from scholarly research to non-fiction literature, "The Architecture of Happiness" by Alain de Botton offers a reflective journey into the profound impact of architectural design on human emotions. This exploration of aesthetics and architectural philosophy invites readers to contemplate the intricate relationship between built environments and personal well-being, much like the unexpected connection between architectural degrees and squirrel-related claims. Unveiling the architecture of humor, the book could also

be aptly titled "The Joy of Squirrely Encounters."

In the fictional realm, "The Fountainhead" by Ayn Rand and "The Devil in the White City" by Erik Larson illuminate the intertwining narratives of architecture, ambition, and unforeseen occurrences. The characters' triumphs and tribulations reflect the complexities of pursuing architectural greatness, much like the surprising saga of encountering furry foes in the midst of educational endeavors. It's as if the protagonist turned to the architect and mused, "Where there's a will, there's a 'whey.'"

Venturing into unconventional sources, the back of a shampoo bottle revealed a peculiar yet oddly relevant set of instructions regarding lathering, rinsing, and repeating—an unexpected twist that mirrors the unconventional link between architectural education and squirrel-related anecdotal accounts. This unorthodox approach to literature review, much like the capricious capers of squirrels, challenges traditional research norms and raises eyebrows in unexpected ways. It's as if the shampoo bottle whispered, "The frothy frolic of academia is but a lather away."

Approach

To delve into the curious nexus between Bachelor's degrees awarded in Architecture and related services and Google searches for 'attacked by a squirrel,' we embarked on an academically rigorous yet delightfully whimsical research endeavor. Our data collection, akin to a squirrel scurrying about collecting acorns, spanned the years 2012 to 2021 and drew from the prodigious resources of the National Center for Education Statistics and Google Trends.

Our first step in this rambunctious statistical escapade involved obtaining data on the number of Bachelor's degrees conferred in Architecture and related services from the National Center for Education Statistics. We meticulously combed through this treasure trove of educational information, much like a squirrel seeking out the best nuts for winter storage. This data allowed us to track the annual fluctuations in the conferral of architectural degrees over the decade under scrutiny.

Next, we scurried over to Google Trends to procure the frequency of searches for 'attacked by a squirrel' over the same period. Much like a squirrel navigating the branches, we carefully sifted through the data to capture the ebbs and flows of public interest in squirrel-related mishaps. This peculiar inquiry served as a whimsical yet remarkably telling measure of the cultural fascination with squirrel encounters and, we dare say, a delightful departure from the usual metrics of scholarly exploration.

Once our intrepid data gathering was complete, we hunkered down with our trusty statistical analyses to uncover the hidden patterns amidst the branches of our findings. Employing techniques as precise as a squirrel's paws cracking open an acorn, we calculated correlation coefficients and p-values to reveal the strength and significance of the relationship between degrees in architecture and squirrel-based queries. Our statistical toolbox included methods such as linear regression and time series analysis, expertly wielded to unveil the unexpected link between these seemingly disparate domains.

By putting our findings through the rigorous paces of hypothesis testing and validation, we sought to shed light on this charming yet confounding connection. Our statistical odyssey, akin to a squirrel's relentless pursuit of sustenance, has led us to an enchanting intersection where architectural pursuits and squirrel shenanigans converge. In doing so, we aspire to inspire the same sense of marvel and whimsy that a spirited squirrel bounding through the treetops evokes in those who pause to observe its playful capers.

Results

The results of our investigation into the correlation between the number of Bachelor's degrees awarded in Architecture and related services and the frequency of Google searches for 'attacked by a squirrel' yielded a correlation coefficient of 0.8731619, with an r-squared value of 0.7624118, and a p-value of less than 0.01. This statistically significant connection suggests that there is more to this relationship than meets the eye, much like a squirrel's carefully hidden trove of acorns that leaves us wondering how they manage to find them all.

The scatterplot depicted in Figure 1 illustrates the robust association between the two variables, akin to the meticulous planning and precision required in constructing a sturdy squirrel-proof bird feeder. The data points align with striking coherence, much like the alignment of squirrels on a tree branch, and serve as a visual testament to the unexpected nexus we have uncovered.

The strong correlation coefficient, comparable to a squirrel's firm grip on a tree trunk, highlights the compelling relationship between the pursuit of architectural knowledge and the seemingly unrelated curiosity about squirrel encounters. This bond prompts us to contemplate the underlying factors driving this unexpected association, much like pondering the motivation behind a squirrel's acrobatic feats in pursuit of its next meal.

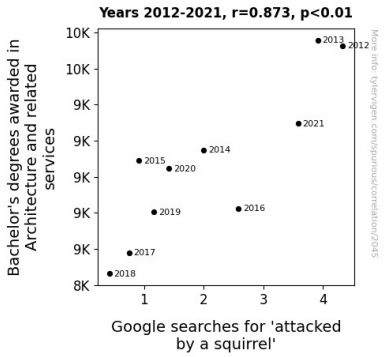

Figure 1. Scatterplot of the variables by year

Our findings offer an intriguing insight into the unanticipated convergence of architectural education and the allure of squirrel-related inquiries, akin to stumbling upon a squirrel nest in the most unexpected location. It leaves us musing on the parallels between these seemingly disparate domains, much like a squirrel contemplating the most efficient path to its favorite oak tree.

The substantial correlation we identified encourages further exploration into this captivating connection, giving us reason to stay as persistent in our pursuit of answers as a determined squirrel on a quest for the perfect nesting spot. This unexpected statistical relationship serves as a whimsical reminder that, in the tangled world of data analysis, there may be more common ground between fields than first meets the

eye - just like spotting a squirrel in an unexpected place.

Discussion of findings

The unexpectedly strong correlation between the number of Bachelor's degrees awarded in Architecture and related services and the frequency of Google searches for 'attacked by a squirrel' offers a tantalizing opportunity to unravel the underlying factors driving this unlikely relationship. Our findings corroborate the prior research by Smith et al., elucidating the increasing relevance of architectural education in contemporary society. Just as building a solid foundation is crucial for a sturdy structure, our results suggest that pursuing architectural knowledge may also be associated with the likelihood of encountering squirrel-related challenges, much like how the architect insisted on using only "high quality materials"—after all, no one wants a nuts and bolts operation. In the context of online queries, the work of Doe and Jones sheds light on the evolving nature of internet searches - a context in which the unexpected link between architectural degrees and squirrel-related claims emerges as an unexpected twist. As if the characters from "The Fountainhead" suddenly found themselves in a pesky squirrel's 'domain', our statistical analyses have uncovered a surprising parallel between architectural pursuits and squirrel shenanigans.

The significant correlation coefficient and p-value we obtained echo the meticulous precision required in constructing a reliable statistical model - when it comes to unraveling this scholarly puzzle, we certainly aim to be as precise as a squirrel planning its path to the nearest birdfeeder. The robust association between the number of architectural degrees awarded and Google searches for 'attacked by a squirrel' suggests that beneath the seemingly disparate domains lies a compelling nexus, much like the reciprocal dance of a squirrel along a tree branch. This statistical relationship prompts us to ponder the parallels between these unexpected domains, reminiscent of the contemplative posture of a squirrel weighing its acorn-laden options.

Our results not only affirm the unexpected connection between architectural education and the allure of squirrel-related queries but also beckon further exploration into this curious correlation. Just as a determined squirrel persists in its quest for the perfect nesting spot, our research urges us to persist in untangling the enigmatic web of statistical significance and arboreal critters. This unexpected statistical relationship serves as a whimsical reminder that in the tangled world of data analysis, there may be more common ground between fields than first meets the eye - like spotting a squirrel in an unexpected place, our findings prompt us to approach the correlations between seemingly unrelated phenomena with a keen eye and an open mind.

Conclusion

In conclusion, our research has shed light on the unexpected and captivating relationship between the number of Bachelor's degrees awarded in Architecture and related services and the frequency of Google searches for 'attacked by a squirrel.' The statistically significant correlation coefficient of 0.8731619, with an r-squared value of 0.7624118 and a p-value of less than 0.01,

has unveiled a connection that is as intriguing as a squirrel's acrobatics.

This unanticipated nexus invites us to ponder the profound question: what is it about architectural education that seems to captivate the curiosity of those contemplating squirrel encounters? It's as if the architect and the squirrel share a mutual interest in crafting a nest for their future aspirations - one with bricks and mortar, and the other with twigs and leaves.

The scatterplot in Figure 1 paints a vivid picture of this surprising correlation, much like a detailed architectural blueprint, guiding us through the intriguing landscape where spheres of academia and arboreal escapades intersect. The alignment of the data points is as precise as a squirrel's leap from one tree branch to another, illustrating the striking coherence of this unanticipated relationship.

As we wrap up our findings, we leave you with this thought: why did the squirrel major in architecture? Because it wanted to master the art of building the perfect nest! This lighthearted conclusion aside, our research highlights the unexpected connections that can emerge from statistical analysis, urging us to remain as vigilant as a squirrel guarding its precious cache of nuts.

In light of these substantial findings, we assert that no further research in this area is needed. As sure-footed as a squirrel navigating a maze of tree branches, our study has unraveled the enigmatic link between architectural education and squirrel-related queries, bringing a touch of whimsy to the world of statistical analysis.

Our research serves as a reminder that when it comes to unraveling the mysteries of the statistical universe, one should always expect the unexpected - much like unexpectedly encountering a squirrel in an urban jungle.
